

Ventilation...

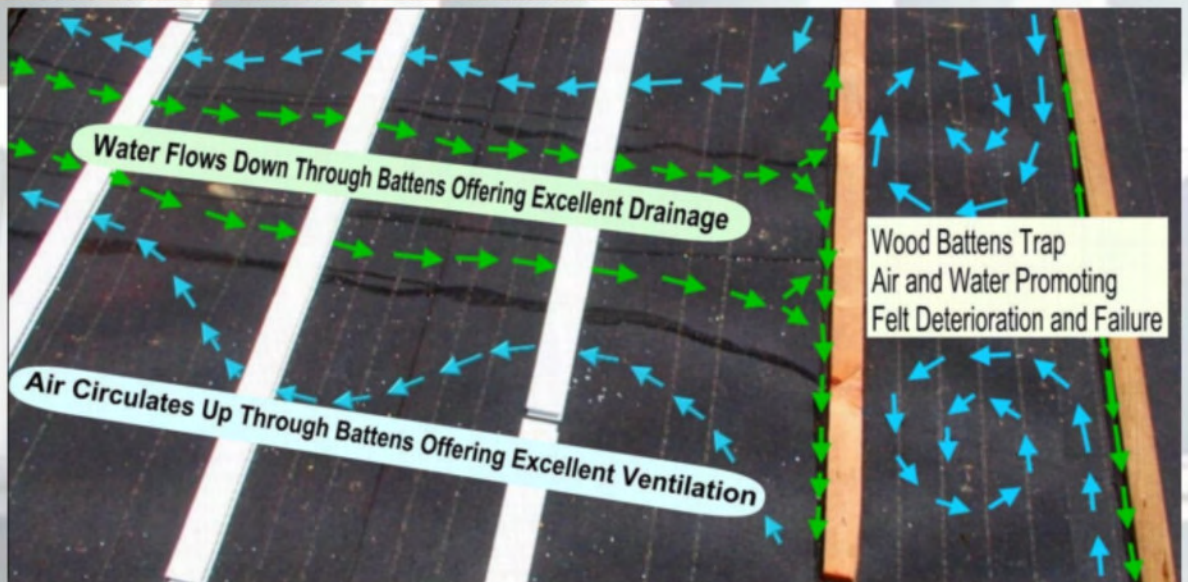

helps you stay cool and dry.

Air circulating under the tiles on the roof have several very important benefits:

1. Circulating air dries the underlayment and sheathing.
 - This helps promote a healthy living environment.
 - No one likes rotting wood, mold and mildew.
2. Cool air displacing hot air under the roof tiles will cool the underlayment and sheathing helping to cool the attic space.
3. Water gets on the underlayment due to overflowing water channels, broken tiles, improper flashings or clogged valleys. Getting the water off of the underlayment the fastest way possible prevents the felt from rot.
4. Condensation and moisture can also be trapped under tiles. The fluted battens provide the necessary ventilation to help dry out any moist areas.

Felt Breakdown and Separation Caused By A Lack of Ventilation
